

Multi-Layer AI Agentic Platform

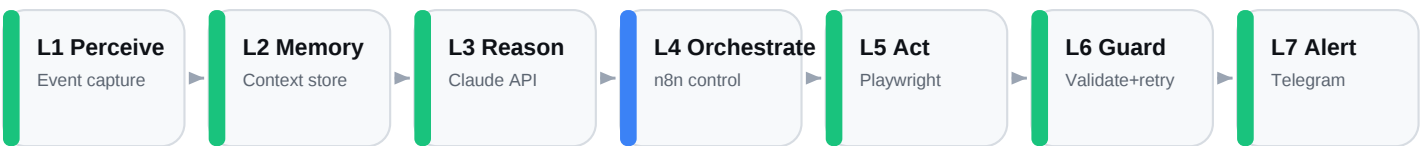

Independent side project · autonomous workflow orchestration

tienwito.com/portfolio

What it is

- A self-directed agent that perceives events, decides, and acts across the web with no human in the loop, recovering from its own failures.
- Runs 24/7 as a service; demonstrates end-to-end agentic design, not a single scripted task.

Seven-layer architecture

Reasoning (Claude) sits behind orchestration (n8n), which drives browser actions (Playwright); guardrails feed failures back for self-healing.

STACK

Impact

- Runs unattended with automatic recovery; compares live signals against external market odds and alerts on edge.
- Proves transferable patterns: API reasoning, orchestration, browser RPA, monitoring, alerting.
